

Engineering a future Civilization

Human beings are naturally social animals. We are diversified into eight basic wisdoms. Although we have different talents and values, we are all gifted with loving hearts. This natural love was pre-programmed by millions of years of evolution and its limited capacity is just enough for small, simple and primitive family systems. It is no wonder that most of us are naturally selfish when offering our limited personal love.

Divided groups of families can unite together for better survival. Progression of civilization is made up of numerous adaptations and improved processes that have allowed us to share our love, sympathy, discipline and capabilities with society and not just within family units. Diversity is an advantage that allows for highly efficient cooperation and specialization. Fostering and optimizing civilized human relationships is a guaranteed strategy for survival.

In order to make smart, fair and civilized decisions, we must adjust and extend our mindsets and value systems. We should also learn to respect diversity, appreciate the mosaic built from multiculturalism and apply Full Spectrum Wisdom.

Love, empathy and sympathy are essential to sustain the development of all civilizations. Without Civilized Love, a group will eventually collapse and disintegrate. However, Civilized Love is not inherently automatic and children must be trained to become contributing members of a civilized society.

It is our responsibility to create a healthy and sustainable future for the generations that follow us. We must design advanced civilized cultural software, teach children the golden principle of dynamic balance, organize civilized systems to care, inspire and support, and train new generations to relay, maintain and optimize cultural heritage. Our ancestors did this for us and we must do the same.
